

The Audit Sword Declaration

The Wall-Facer issues no prohibitions. The Wall-Facer leaves a sword.

The SCX framework (including Yajie, Situs, Spring, State Crystallization, and all derivative algorithms) is an open-source mathematical toolkit. Anyone may read, reproduce, and deploy it.

We do not prohibit any specific use.

We retain one inalienable right:

Any organization using the SCX framework for data quality assessment renders its assessment results verifiable and auditable by independent third parties through the same mathematical methods. Military use is not exempt.

This is not a restriction. It is deterrence. The audit sword does not discriminate.

Mathematical Basis

Yajie's Theorem 1 guarantees that multi-expert consensus detects label noise with exponentially decaying false-positive probability. Any party with access to the same M expert models and the same dataset can independently reproduce the consensus score $C(x)$ and verify the audit result. No cooperation from the original auditor is required. The audit is conducted from outside the organization, using only outputs the organization voluntarily makes available.

Guaranteed by theorems. Externally reproducible. No permission required.
